

Sandy gungan *Uperoleia fusca*

Photo : Queensland Museum

- A small frog to about 30mm with blotchy colouration of greys and browns (very similar to *U. laevigata* and *U. rugosa*).
- Upper forearm, groin and hind surface of the thigh are coloured with yellowish/orange patches.
- Found when breeding in summer in open Eucalypt forests, grasslands and coastal heath where the male calls from the base of grass clumps next to water.
